

**The open platform**  
for finance market data

# One platform

## The challenge:

### Complexity and high costs

Banks and investment houses often manage their finance market data with heterogeneous system landscapes.

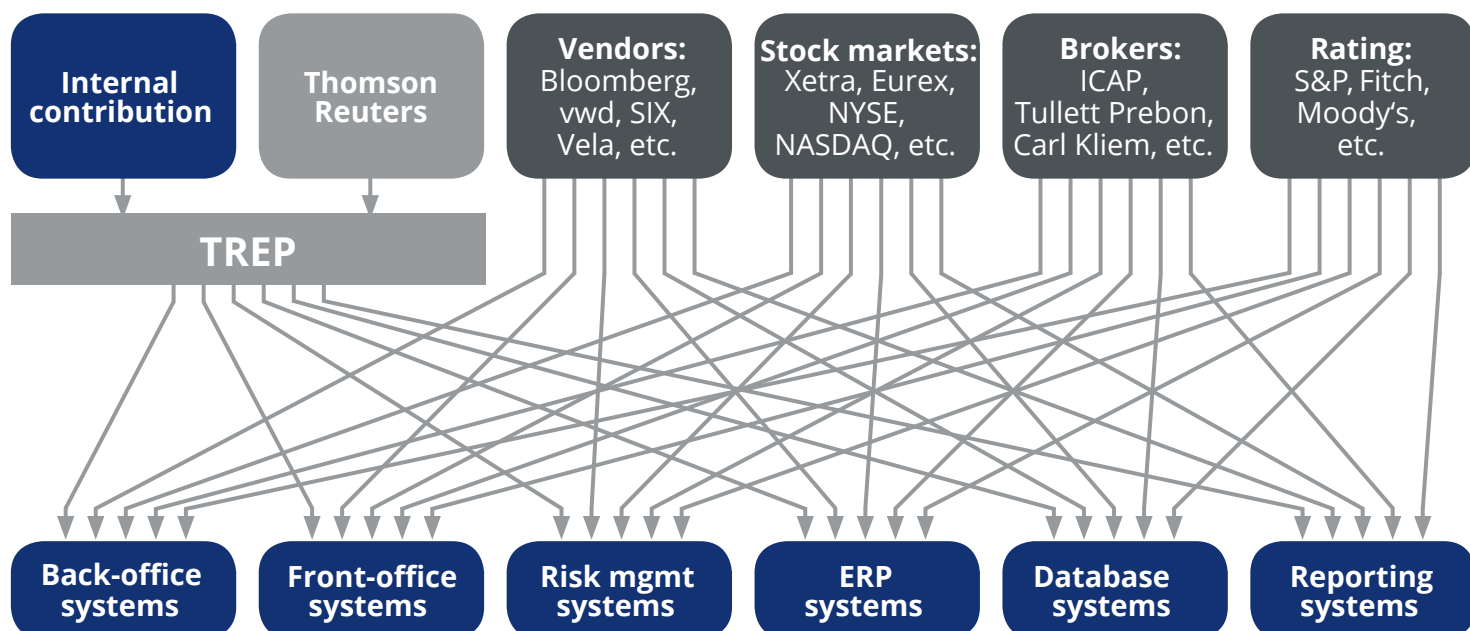

In parts, the market data is distributed and administered via a vendor-specific platform, such as the Thomson Reuters Enterprise Platform (TREP).

Other data sources can often not be routed and managed via this one platform. Due to technological obstacles or because the platform provider's contract conditions do not allow this.

This data has to be individually connected to receiving systems through a number of interfaces (APIs).

Using such a heterogeneous landscape causes avoidable costs, such as:

- View Charges
- License fees for the distribution of your own data via the platform
- License fees for feeding third party data into the platform
- High costs for the creation and administration of individual interfaces
- Additional charges for the purchase and operation of various management and reporting systems
- To avoid these costs, lower priced market data by alternative vendors is often not used. The potential savings in the areas of infrastructure operation and market data purchasing can be substantial, but are often ignored.

# Two aims

## The Solution:

### DOME

Due to the openness of these interfaces it is very easily possible to integrate data sources, applications, databases etc. DOME dissolves the dependencies between the infrastructure providers and the data suppliers. Using an open interface standard enables us to transfer a heterogeneous system landscape into a standardised platform.

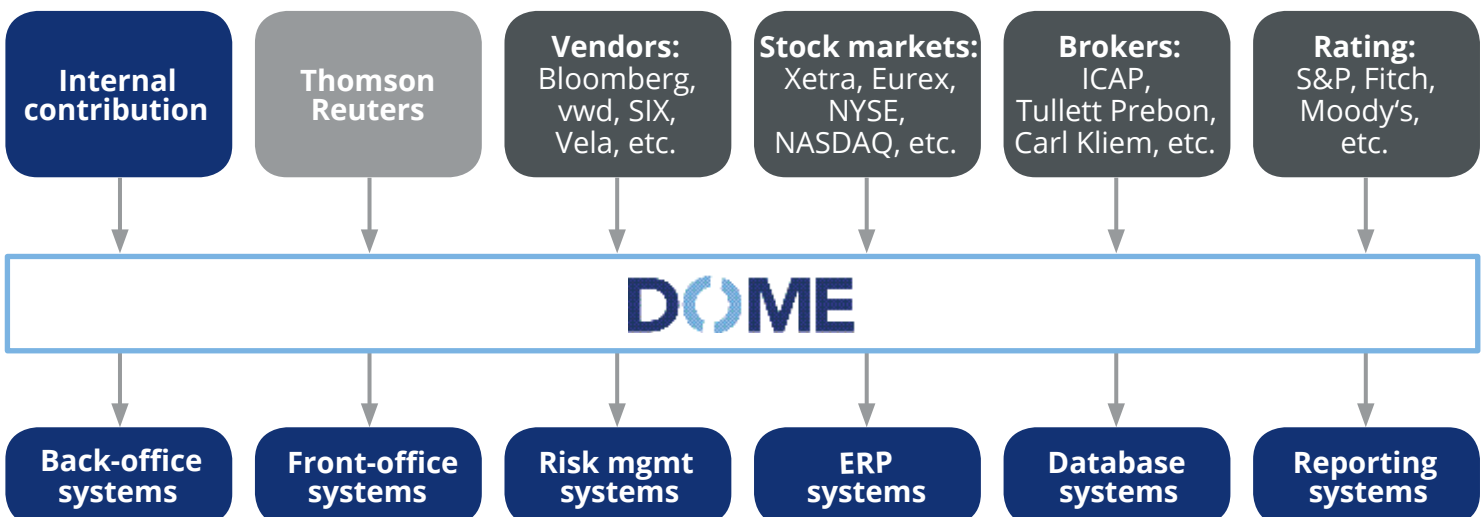

The entire data traffic is routed and managed via DOME. Entitlement processes, authorisation concepts, irregular interfaces and much more can be harmonised and operative efforts can be substantially reduced or automatised. Moreover, DOME allows to obtain data from suppliers who cover your needs in the most efficient way.

## DOME ...

- is based on openMAMA, an open standard API (licensed under LGPL 2.1 license)
- is independent from software developers and data suppliers
- has a consistent authorisation concept
- offers high performance and stability
- has a transparent and fair licensing model
- allows for standardised integration of data sources and answering systems
- significantly simplifies the interface management

## One platform – two aims

- Consolidation of your market data infrastructure
- Flexibility in the purchase of finance market data

## Who we are

dacoma GmbH is the leading independent consulting firm for finance market data in the German-speaking countries.

We have been helping our clients achieve a reliable and efficient market data provision since 1999. Experience from more than 100 project years, a continuous development and the entire team's personal commitment are part of our DNA.
